Attention is all you need (2017)

CNN, RNN and Transformers

Pro: Compute in Parallel

Con: Finite Horizon

Pro: Infinite Horizon

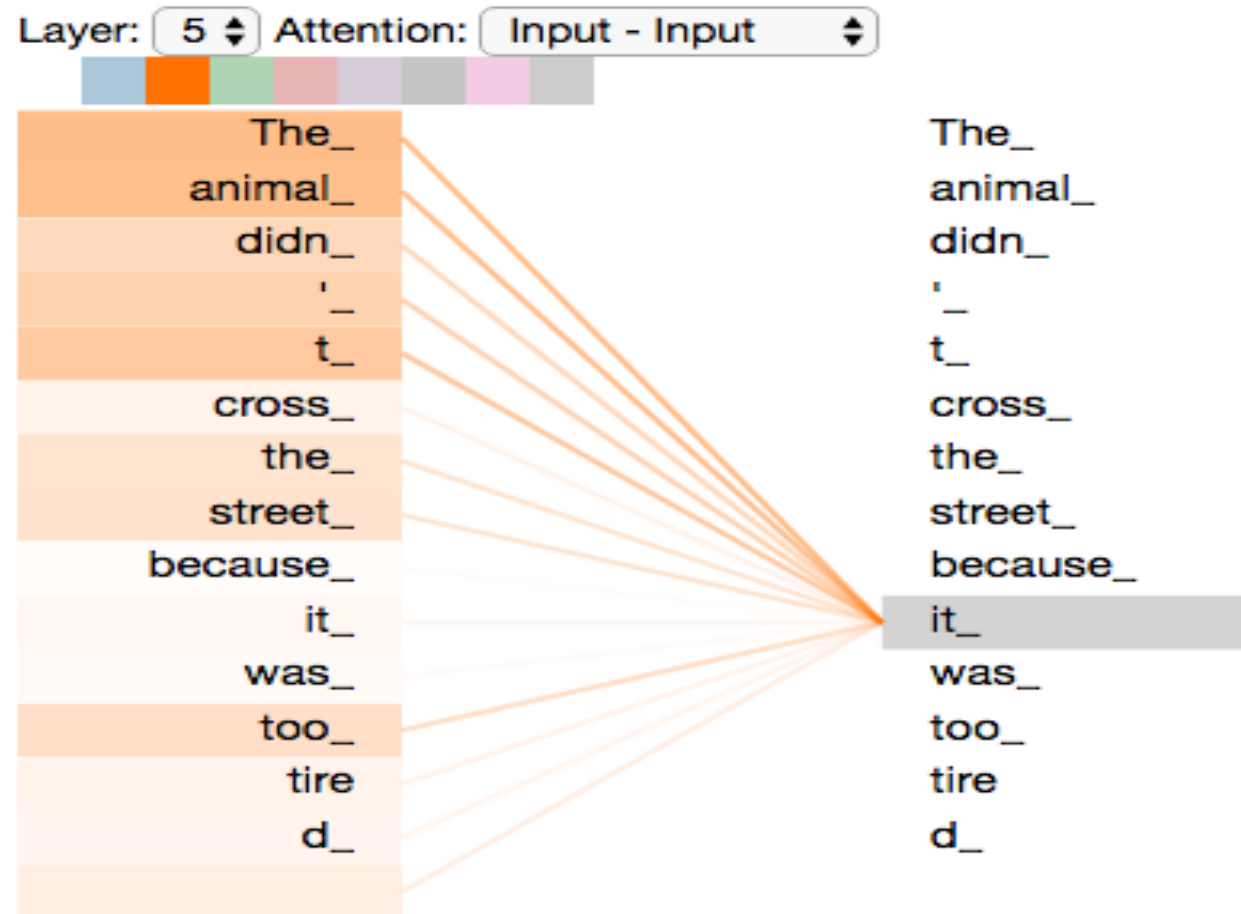

Con: Compute Serially only

Attention

Blank Slide

I. Simple Self Attention

Self Attention

1. The **animal** did not cross the road because **it** was too tired.
2. The animal did not cross **the road** because **it** was too wide.

SA: Computation

$$y_i = \sum_j w_{ij} x_j$$

$$w_{ij}^0 = x_i^T x_j$$

$$w_{ij} = \frac{\exp w_{ij}^0}{\sum_l \exp w_{il}^0}$$

Blank Slide

SA: Observations

- Input and Output:
 - Vectors are of same in number and dimension
 - Set of vectors (in simple form). Add position, if required.
- Every output vector is influenced by “all” input vectors.
- “W” is not learned here. It is computed from the input/data.

SA: Computation

$$y_i = \sum_j w_{ij} x_j$$

$$w_{ij}^0 = x_i^T x_j$$

$$w_{ij} = \frac{\exp w_{ij}^0}{\sum_l \exp w_{il}^0}$$

As matrix operations

VECTORIZED

Blank Slide

Example

Query, Key and Value

KEYS, QUERIES AND VALUES

In each self attention computation, every input vector occurs in three distinct roles:

- **the value:** the vector that is used in the weighted sum that ultimately provides the output
- **the query:** the input vector that corresponds to the current output, matched against every other input vector.
- **the key:** the input vector that the query is matched against to determine the weight.

Blank Slide

Example

We ask: what is the value of $\begin{bmatrix} 2 \\ 0 \\ 3 \end{bmatrix}$? $y = \sum_{j=1}^N (k_j^T q) \cdot v_j$

keys	values	weight
$\begin{bmatrix} 0.5 \\ 0.5 \\ 0 \end{bmatrix}$	1	$k_1^T \cdot q = [0.5, 0.5, 0] \cdot \begin{bmatrix} 2 \\ 0 \\ 3 \end{bmatrix} = 0.5 * 2 + 0.5 * 0 + 0 * 3 = 1$
$\begin{bmatrix} 0.5 \\ -0.5 \\ 0 \end{bmatrix}$	3	$k_2^T \cdot q = [0.5, -0.5, 0] \cdot \begin{bmatrix} 2 \\ 0 \\ 3 \end{bmatrix} = 0.5 * 2 + (-0.5) * 0 + 0 * 3 = 1$
$\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$	5	$k_3^T \cdot q = [0, 0, 1] \cdot \begin{bmatrix} 2 \\ 0 \\ 3 \end{bmatrix} = 0 * 2 + 0 * 0 + 1 * 3 = 3$

$= 1 * 1 + 1 * 3 + 3 * 5 = 19$

Blank Slide

What is Attention?

$$y_i = \sum_{j=1}^N (k_j^T q_i) \cdot v_j$$

$$\text{softmax} \left(\begin{matrix} [Q \times d_k] & \times & [d_k \times K] \\ \text{Matrix} & & \text{Matrix} \end{matrix} \right) \times [V \times d_v] = [Q \times d_v]$$

The diagram shows the matrix operations for the Attention mechanism. A blue box with horizontal lines represents the matrix $[Q \times d_k]$. A green box with vertical lines represents the matrix $[d_k \times K]$. These are multiplied together and passed through a softmax function. The result is then multiplied by a purple box with horizontal lines and an arrow, representing the matrix $[V \times d_v]$. The final output is $[Q \times d_v]$.

Blank Slide

II. (Weighted) Self Attention

Learnable “Query”, “Key” and “Value”

$$\mathbf{k}_i = \mathbf{K}\mathbf{x}_i + \mathbf{b}_k$$

$$\mathbf{q}_i = \mathbf{Q}\mathbf{x}_i + \mathbf{b}_q$$

$$\mathbf{v}_i = \mathbf{V}\mathbf{x}_i + \mathbf{b}_v$$

$$\mathbf{q}_i = \mathbf{x}_i \mathbf{W}^Q; \mathbf{k}_i = \mathbf{x}_i \mathbf{W}^K; \mathbf{v}_i = \mathbf{x}_i \mathbf{W}^V$$

Blank Slide

Self Attention

One query per input vector

Inputs:

Input vectors: X (Shape: $N_X \times D_Q$)

Key matrix: W_K (Shape: $D_X \times D_Q$)

Value matrix: W_V (Shape: $D_X \times D_V$)

Query matrix: W_Q (Shape: $D_Q \times D_Q$)

Computation:

Query Vectors $Q = XW_Q$

Key vectors: $K = XW_K$ (Shape: $N_n \times D_k$)

Value Vectors: $V = XW_V$ (Shape: $N_n \times D_v$)

Similarities: $E = \frac{Q \cdot K^T}{\sqrt{D_k}}$ (Shape: $N_n \times N_n$) $E_{\%} = (Q_{\%} \cdot K) / \sqrt{D_k}$

Attention weights: $A = \text{softmax}(E, \text{dim} = 1)$ (Shape: $N_n \times N_n$)

Output vectors: $Y = AV$ (Shape: $N_n \times D_v$) $Y_{\%} = \sum A_{\%} V$

Blank Slide

Self Attention: Computation

Example of Cross-Attention

- Task:
 - Given an Image (a set of patches), create a sentence
- Need of attention:
 - At any stage of creating a word, attend more to the region that is relevant

Cross Attention

Source: "Attention Is All You Need" (<https://arxiv.org/abs/1706.03762>)

Example: Note that the queries usually come from the decoder, and the keys and values usually come from the encoder.

III. Discussions

CNN, RNN and Transformers

Pro: Compute in Parallel

Con: Finite Horizon

Pro: Infinite Horizon

Con: Compute Serially only

Attention

Visualization

Example: English to French translation

Input: “The agreement on the European Economic Area was signed in August 1992.”

Output: “L’accord sur la zone économique européenne a été signé en août 1992.”

Visualize attention weights $a_{t,i}$

Diagonal attention means words correspond in order

Attention figures out different word orders

Diagonal attention means words correspond in order

CNN with Attention

CNN with Attention

Self Attention Module

Self Attention Layer

Self Attention: Comments

- Self attention learns the relationship between elements in a sequence.
 - say between words in a sentence
- Self Attention Vs Convolution
 - Filters are dynamically calculated instead of static filters
 - SA is invariant to changes in the input points
 - SA can operate on irregular inputs
- SA allows to learn global and local features
 - Hierarchical feature learning by cascading

Conceptual Comparison

Recurrent Neural Network

- Works on Ordered Sequences
- Long range dependence (in the past)
- Not parallelizable

1D Convolution

- Works on Multidimensional grids
- Short visibility; Stacking helps
- Highly parallelizable

Self-Attention

- Works on Sets and Sequences
- Long range dependence
- Parallelizable
- Memory Intensive

Thanks!!
